

React JS

Description

Kanban board is the most popular agile task management tool. In this project, you need to implement a kanban board for simple task management. Take a look at the wireframe <https://wireframe.cc/GTR3dJ> where you get a very basic layout of the required kanban board. There is a text box where the user will write a task and when the user hits the Add button it will be added as a card on the "To Do" Board. Then the user can drag and drop the card on any one of the boards "In Progress" or "Done".

Here are some simple actions users are allowed to do

1. The user creates a task card and it will be added to "To Do" board
2. The user can change the task card by drag and drop

We are expecting the following thing from you

1. You are using React for this project
2. You are following the wireframe
3. Drag and Drop transition should be smooth
4. You are using Redux for state management
5. You are using Redux thunk/ Saga for middleware
6. Store the data in localStorage

Deadline

5 Days

How to Submit

You need to upload your project on a public repository (such as GitHub) and sent an email to orangetoolztech@gmail.com with the repository link.

If you have any queries regarding project you can email on rajib@orangetoolz.com
